Assignment 17.1

Simple Inheritance in scala.

```scala
Class versionA {

    def a(){

            println("version1")

}

}

    Class versionB    extends versionA{

            def b(){

            println("version2")

}

}

Object inherit{

def main (args:Array[String]){

        val obj=new versionA

        obj.a

          obj.b

}

}
```

Multilevel inheritance

```
Class versionA {

    def a(){

            println("version1")

}

}

    Class versionB    extends versionA{

              def b(){

            println("version2")

}

}

class versionC    extends versionB{

def c () {

        println("version3")

}

}

Object inherit{

def main (args:Array[String]){

        val obj=new versionC

          obj.a

            obj.b

            obj.c

}
```

}
